

Current-Time-Sensitive Agenda Widget for ANDROID with Context

The Widget I Wish You'd Make For Me:

I was looking for Android agenda widgets while stoned and realized that when sober the widgets I use will work. When altered I need an agenda widget that looks like this. The nice thing is this agenda is compatible with sober-me as well so if I had it I could use it for both. It doesn't need to be smart or pretty – just very simple and clear. Here is an example of what the display could show (depending how configured – just make it so I can pick how many days to look ahead and I'll be happy).

Real Picture of how I want it to look:

now:	breakfast at charlie's	(15 min)
imminent:	see mom re: money	(45 min)
	drop off updated contract	(55 min)
soon:	work at east site	(2 hrs)
today:	get milk on the way home	(17:00)
	clean bird cages at home	(17:30)
tomorrow:	speak at mmfl convention	(morning)
this week:	cick up jimbo at the airport	(5 days)
beyond:	vacation	(24-Feb)

Comments (each for its own row on the display):

- User picks whether we see end time for "now"

- Should count down per min from ~2 hrs or U.C.*

- Count down by hours or half-hours here.

- Show start time or U.C.

"Tomorrow" has morning, midday, afternoon, eve

*U.C. = User Configurable.

- User picks whether to show each of the last three and how far ahead to look.

- 1) Categories (at least) NOW, TODAY, TOMORROW, THIS WEEK. Optional categories (things it would be nice to have but if we have them let us enable / disable them): IMMENENT and BEYOND [this week].
- 2) For NOW category, user should be able to decide whether to show how much of an event is left (sometimes we don't specify the end time in our calendar entries so we want the option to make that field blank).
- 3) All times placed in context to 'now' from user's frame of reference as listed above. The start time is a good choice for the TODAY category.
- 4) If IMMINENT category is included, user can disable or decide how soon is 'imminent.' And the timer should be counting down by the minute.
- 5) Updates in the SOON category don't require refreshing but every 15min or use fractional hours in the display.
- 6) Author decides when morning, mid-day, afternoon, evening are for the THIS WEEK category. It would take too long to make user-configurable.
- 7) Display should be very similar to what I've got there. Extremely simple, space-saving formatting with clear, differentiable delineation of categories and events within categories.
- 8) Please give me the option of toLower()ing everything (or whatever it's called).

I really hope to see this widget soon. I don't have the knowledge now to write it and I don't have the time to learn how with babies number one and two and 175 students to take care of. Thanks! fruzzetti@gmail.com
